**PREVIOUS RESEARCH EXPERIENCE**

▪ **Post-Doctoral Research – University of California, Berkeley – Long Lab**

- Discovery of, and molecular-level investigation into, the chemically specific cooperative adsorption mechanism of the commodity chemical carbon disulfide in diamine-appended metal–organic frameworks.
- Structural investigation of the origins of non-classic step-shaped adsorption in stimuli-responsive zeolitic imidazolate frameworks for storage and delivery of natural gas in the transportation sector.

▪ **Dissertation Research – Northwestern University – Mirkin Lab**

- Established a platform for the *in situ* control of hydrogen bond-donating catalysis, based on a novel synthetic strategy that employed structurally addressable supramolecular coordination structures. These architectures have potential applications in controlled polymerization, chemical sensors, and amplification devices.

- Harnessed the three-dimensional structural order of metal–organic frameworks for dramatically enhancing the activity of hydrogen bond-donating catalysis through the deliberate obviation of deleterious inter-catalyst association.
